SUPPORTING PLATE FOR CONCRETE BEAM SYSTEM AND PROCESS FOR THE PRODUCTION THEREOF, tr. by P. C. C. 31 Mar 61, 4p. (5 figs. omitted). Order from LC or SLA mi\$1.80, ph\$1.80 61-19479

Trans. of Finnish patent 23,169, cl. 37 b 4/01, by Oy, Firm Productia, Ab., pat. from 28 July 45, granted 10 Sep 48, pub. 21 Apr 49 (priority of appl. 13 Sep 44).

The plate is made of a pressed or cast material, e.g., wood wool or elastic or fibrous material, and cement or other binder. This plate is designed to provide the necessary heat and sound insulation and to form a base for plaster or the like and can also suitably be used as a mold or supporting layer in the beam system casting operation. Connecting members are anchored in the material and project outside the plate surface so as to be fixed in the concrete beam (Materials, TT, v. 5, no. 11) (over)

Experiments were completed to study possibilities to obtain higher yields from poplar pulps made by the sulphate process. Cooks were carried out by a variation of cooking parameters and with warm liquor pre-impregnation. It was shown, that 30% to 40% of wood substance is solubilized even after a very mild treatment. The defibrering and beating properties of different semipulps can be represented in linear form with the aid of scale transformation. Such representation makes it possible to investigate the behaviour of different raw materials under different cooking conditions with regard to defibrability. Furthermore, it is shown that with extensive delignification a product can be obtained which does not as yet disintegrate into (Engineering-Chemical, TT, v. 8, no. 9) (over)
